Delayed Diagnosis of Rheumatic Heart Disease
Deepa Bhanot, MD, Jill Hanrahan, MD, Wassim Shaheen, MD

Introduction
Non-suppurative cardiovascular sequelae of group A streptococcal pharyngitis remain medical and public health problems worldwide, though more rampant in the developing world. The mean incidence is 19 cases per 100,000 persons in the developing world and 2 to 14 cases per 100,000 persons in the United States.

Case Presentation
A 32-year-old female presented to the ED complaining of shortness of air. CT of the chest showed bibasilar interstitial lung infiltrates and pulmonary congestion. She was sent home. One one week later, she presented with pulmonary edema requiring mechanical ventilation. Two dimensional echocardiography showed severe mitral stenosis and moderate aortic insufficiency, consistent with rheumatic valvular disease. Dual valve replacement was performed 15 days later, with resolution of symptoms.

Conclusions
Diseases forgotten in the developed world should still be present in the differential diagnosis. Failure to recognize them may be fatal.
